

## Appendix K Metadatabase, GIS and Bibliographic Database

(Note that licensed data is held within this Appendix. Please consider before distributing.)

## APPENDIX K - CONTENTS

	Page
K1 INTRODUCTION	1
K2 BIBLIOGRAPHIC DATABASE	1
K3 GEODATABASE	1
K3.1 Aims	1
K3.2 Geodatabase Development	2

## **K1 INTRODUCTION**

Appendix K essentially comprises two electronic deliverables, the Geodatabase and the Bibliographic Database. This short Appendix provides an overview of the aims and objectives of each of the two deliverables and the method behind their development.

## **K2 BIBLIOGRAPHIC DATABASE**

The Bibliographic Database is a key requirement of Royal Haskoning's Quality Management System (QMS) and was developed in order to record, store and track all incoming documents received as part of the Poole and Christchurch Bays SMP2 project. It also provides a record of the type of check undertaken on the data at the time of receipt.

The format of the bibliographic database is a simple Microsoft Excel spreadsheet which can be used to sort/find the data. Each new piece of incoming data was assigned a unique identification number (in the format ID+number) which allowed easy identification and retrieval of specific information throughout the project. The database shows the title and author of the data, the date of production and any key notes regarding the data itself and potential limitations/problems.

The bibliographic database shows the receipt of the key SMP data as set out in Appendix B of the SMP Guidance (Defra 2006). This includes the national "standard data package", existing datasets from the original SMP (SMP1), all scheme and strategy plan information from within the SMP area, and any new information produced since development of SMP1, such as shoreline monitoring and coastal research data and data from relevant national studies (such as Futurecoast).

## **K3 GEODATABASE**

### **K.3.1 Aims**

The aim of the Geodatabase is to record all the data used within the SMP using a GIS-based data management tool. This includes all of the data gathered and results of the Theme Review and Coastal Processes Assessment tasks undertaken as part of Stage 2 (as reported in detail in Appendix C).

The overall aim of the Geodatabase is to assist coastal managers in their management and decision-making, not only at national level but also in policy decisions at a local level. Managing and presenting the data for the new generation SMPs in digital format has been beneficial to coastal management as well as data management. It has moved the possibilities of data utilisation on since the first generation of SMPs which were presented in hard copy text and mapping format.

The tool enables the end user to view all of the collated information in a geographical context. It also allows the user to import/update and export database information.

### K.3.2 Geodatabase Development

The Poole and Christchurch Shoreline Management PMF tool is an easy to use GIS tool that allows the user to navigate and view data along the coastal frontage of the SMP. The PMF displays all SMP data from Hurst Spit to Durlston Head giving the user the functionality to zoom and pan freely along the coastline and the choice of which features to display on detailed OS background mapping. Due to all the data being held within a Geographical Information System all the data is referenced geographically which gives users the ability to query coordinates and measure distances within the view frame.

The tool consists of two parts:

- The GIS PMF Viewer
- Mapping and Shapfile data

All the SMP data is stored as Map layers within the PMF. Examples of the types of data included are:

- SMP Boundaries – Policy Units, Management Areas, Policy Development Zones.
- Erosion – Erosion polygons and polylines for No Active Intervention and With Present Management
- Nature conservation – such as environmental designations
- Heritage/cultural - such as Scheduled Ancient Monuments, protected wrecks and listed buildings.
- Flood Zones – EA Flood Zones, SMP increased probability of flooding.

An additional feature is that the specific ID numbers relevant to the Source for the data stored within the Tool relate to the number of the entry within the Bibliographic Database.
