**ANNEX H1: SUPPORTING ECONOMIC APPRAISAL DATA – DAMAGES/BENEFITS**

**ANNEX H2: SUPPORTING ECONOMIC APPRAISAL DATA FOR SMP COSTS**

**ANNEX H3: SUPPORTING INFORMATION FOR SENSITIVITY TESTING**

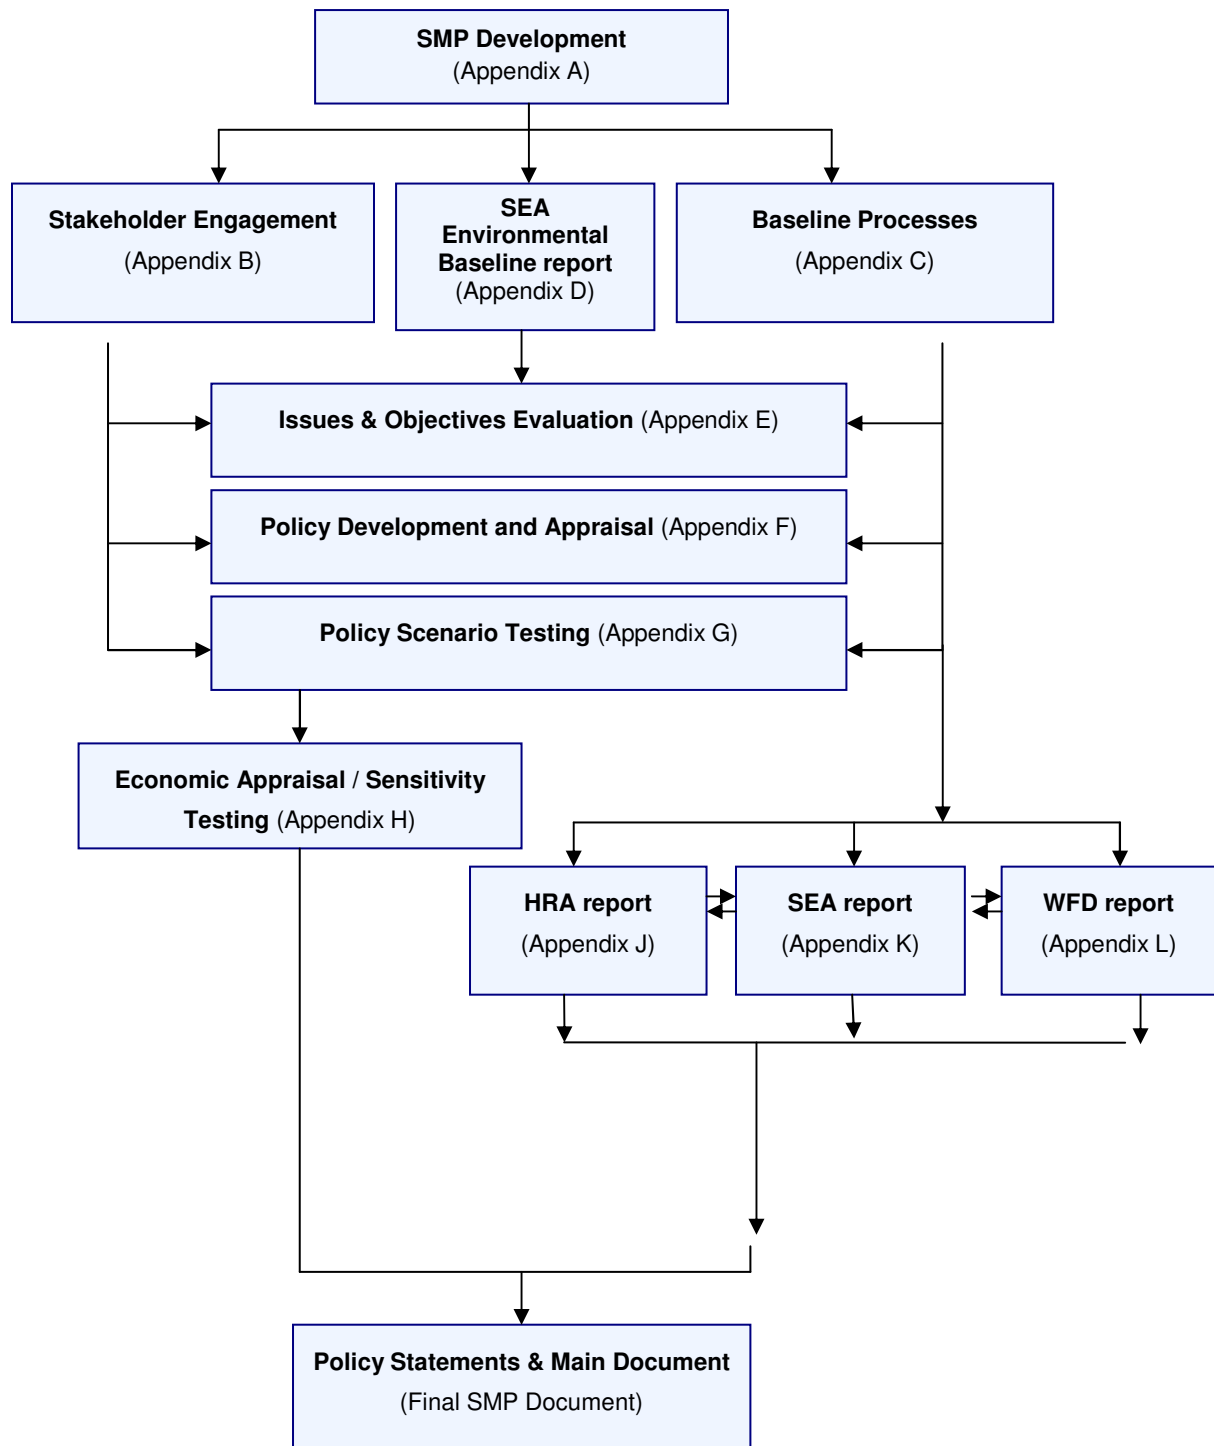

**ANNEX H4: EXAMPLE MANAGED REALIGNMENT EXTENTS FOR ECONOMIC CALCULATIONS**

## The Supporting Appendices

This appendix and the accompanying documents provide all of the information required to support the Shoreline Management Plan. This is to ensure that there is clarity in the decision-making process and that the rationale behind the policies being promoted is both transparent and auditable. The appendices are:

A: SMP Development	This reports the history of development of the SMP, describing more fully the plan and policy decision-making process.
B: Stakeholder Engagement	All communications from the stakeholder process are provided here, together with information arising from the consultation process.
C: Baseline Process Understanding	Includes baseline process report, defence assessment, NAI and WPM assessments and summarises data used in assessments.
D: SEA Environmental Baseline Report (Theme Review)	This report identifies and evaluates the environmental features (natural environment, landscape character, historic environment, land use, infrastructure and material assets, and population and human health).
E: Issues & Objective Evaluation	Provides information on the issues and objectives identified as part of the Plan development, including appraisal of their importance.
F: Initial Policy Appraisal & Scenario Development	Presents the consideration of generic policy options for each frontage, identifying possible acceptable policies, and their combination into 'scenarios' for testing.
G: Scenario Testing	Presents the policy assessment and appraisal of objective achievement towards definition of the Preferred Plan (as presented in the Shoreline Management Plan document).
<b>H: Economic Appraisal and Sensitivity Testing</b>	Presents the economic analysis undertaken in support of the Preferred Plan.
I: Metadatabase and Bibliographic database	All supporting information used to develop the SMP is referenced for future examination and retrieval.
J: Habitat Regulations Assessment	Presents an assessment of the effect the plan will have on European sites.
K: Strategic Environmental Assessment	Presents the Strategic Environmental Assessment of the Plan.
L: Water Framework Compliance	Presents a retrospective Water Framework Directive Assessment.

Within each appendix cross-referencing highlights the documents where related appraisals are presented. The broad relationships between the appendices are as below:

# H1 Introduction

A review of economic viability has been carried out for the Preferred Plan and its associated policies.

It should be noted that this review is not to establish the economic justification for a scheme as defined by Defra's Flood and Coastal Defence Project Appraisal Guidance Note 3: Economic Appraisal (FCDPAG3). The review makes a broad assessment of the economic robustness of the preferred policies. The economic review therefore determines whether or not each policy is:

- Clearly economically viable;
- Clearly not economically viable; or,
- Of marginal viability (and therefore may be in need of more detailed assessment at a later date, e.g. as part of a strategic plan, although some commentary on this is provided within this report).

It must be recognised that the justification for a particular policy is not necessarily dependant on economic viability alone; as impacts on other benefits may be considered more important (e.g. Holding existing defences to sustain a designated habitat). Any policies where this is the case may not be considered economically efficient under current Treasury guidance.

The following sections detail how the economic assessment has been undertaken. This is followed by a series of economic statements for each policy unit, and spreadsheets providing the numerical analysis performed as part of the SMP.

## H2 Use of existing information

The following datasets were consulted to obtain information for the economic review:

- National Property Dataset – for property locations;
- <http://www.upmystreet.co.uk/> - for property prices;
- Defra Agricultural Land Values (2006) – for agricultural land values;
- SMP Guidance – for defence costs;
- Futurecoast (Defra 2002) – for guidance on erosion rates; and,
- Environment Agency Indicative Floodplain – for indicative flood mapping.

## H3 Generation of new data

As there is very limited existing information that can be used directly to confirm robustness of the SMP policy, new economic data has been derived through application of the Modelling and Decision Support Framework (MDSF) tool (which consists of a customised GIS (ESRI ArcView) and a data management toolkit). This 'Broad-scale Economic Review', described below, uses nationally available information on property locations and values, and the risk maps developed through the assessment of shoreline interactions and responses (**Appendix C**).

### H3.1 DETERMINING DAMAGES AND BENEFITS

The benefits are the damages averted or deferred by the Preferred Plan, i.e. the difference in losses between implementing this and the No Active Intervention (NAI) scenario. These have been calculated for each epoch.

Although policy appraisal has determined a 'zone' of likely future erosion, for the purposes of estimating possible benefits, only the most landward extent of the likely erosion (for each period: 0-20, 20-50 and 50-100 years) has been used in the present analysis. These lines have been mapped and overlain with the property location/value data to calculate potential economic losses and economic benefits for the NAI scenario and the Preferred Plan scenario. It should be noted that average erosion rates used for this SMP are estimates (see **Appendix C**) as no site specific erosion data is available for either the Medway or Swale estuaries. As such, erosion losses calculated by MDSF are indicative and therefore should be used accordingly.

In areas where there is a flooding risk, no attempt has been made to undertake detailed flood risk modelling; rather areas identified as at flooding risk by the Environment Agency's flood mapping have been used to identify assets potentially at risk (Flood Cells). The potential damages in these areas are simply taken as the summed value of all the 'at risk' assets. This is based on the assumption that under a NAI scenario flood defences would fail and all at risk assets would be inundated and become uninhabitable. This is taken as an indicative figure for the assets potentially protected by defence structures. Flood damages have been calculated on a Policy Unit by Policy Unit basis only, based on damages within Flood Cells. It should be noted that along a number of frontages, one Flood Cell covers multiple policy units. For plan wide cost benefit analysis, benefits for these flood cells have been shared and the costs aggregated across Policy Units to avoid double counting.

In calculating damages and benefits for the preferred scenario, no account has been taken of the potential for short-term accelerated or delayed losses compared to NAI, other than the total adjustment in shoreline position at the end of each epoch.

The SMP does not take account of standards of protection as it is only defence management policy that is being determined. Standards of protection relate to implementation of these policies, which is usually undertaken within more detailed 'strategy' level studies.

#### H3.1.1 Benefit values

For properties, losses and benefits have been calculated only on the basis of residential and commercial property values. Other assets, such as utilities, highways, and intangibles, such as recreation, and other impacts upon the local economy or environment, have not been valued or included. Exclusion of these factors will robustly confirm economic viability, as these would provide

added value. Losses and Benefits have been calculated using MDSF. This was populated with data from a national property database. The database is built from the Ordnance Survey Address Point dataset and the Valuation Office Focus database. Address Point identifies the location of all existing properties. The Focus database then identifies which are non-residential (i.e. commercial/industrial) and provides a rateable value from which an approximate capital value is obtained, by applying a conversion factor. The remaining properties are assumed to be residential and current average residential property prices are obtained from [www.upmystreet.co.uk](http://www.upmystreet.co.uk), which provides property price statistics by postcode.

Using the 20, 50 and 100 year erosion contours, MDSF has been used to calculate the Capital Value (CV) and discounted Present Value (PV).

For the flood risk areas, GIS has been used to simply sum the CV for all built assets within the flood area, using the property database.

### **H3.1.2 Generation of new defence cost information**

Future coastal defence management approaches for each Policy Unit have been developed as part of the Preferred Plan. From this, the broad replacement and maintenance requirements for each epoch have been determined.

Where there is no existing information relating to future defence costs for an area, e.g. from a strategy plan or scheme design, costs have been generated using other nationally available information.

#### **(a) Cost Rates**

Replacement costs for general defence types have been taken from the revised Shoreline Management Plan Guidance<sup>1</sup>. This suggests average replacement costs for linear structures (e.g. revetments, seawalls) as £2.7million/km and costs for beach management schemes at £5.1million/km. Replacement costs for Groynes, embankments and other "low cost" defence types are taken as £0.6million/km.

Maintenance costs have been taken from the Defra National Appraisal of Defence Needs And Costs (NADNAC) study<sup>2</sup>. This used annual maintenance costs for linear structures and for groyne fields at £10,000/km, and for beach schemes £20,000/km.

#### **(b) Cost Calculations**

It has been assumed that the timing of full scheme reconstruction required (i.e. design life) is at least once every 100 years for linear defences, such as seawalls and revetments; every 50 years for beach schemes; and every 30 years for groynes and embankments. However, these periods may become more frequent for areas where erosion potential is high, e.g. on the outside of meanders and in confined channel locations. Maintenance has been assumed to be the same rate every year throughout the life of the scheme. In reality, this will be less in the early years and will increase in later

<sup>1</sup> Defra (2006) Flood and Coastal Defence Appraisal Guidance, FCDPAG3 Economic Appraisal, Supplementary Note to Operating Authorities – Climate Change Impacts, October 2006.

<sup>2</sup> Defra (2004) NADNAC National Appraisal of Defence Needs and Costs Study.

years of the scheme's life. However, for the broad brush appraisal undertaken for the SMP this will make no difference to decisions.

Allowance has also been made for the increase in costs due to climate change, based upon factors developed for the NADNAC study. This takes account of the need to make structures higher, deeper, and more resilient to increased exposure. The assumptions were: no cost increase for the 0-20 year epoch; costs factored up by 1.5 times present day rates for the 20-50 year epoch; and costs factored up by 2.0 times the present day rates for the 50-100 year epoch.

Optimism bias in accordance with most recent Defra guidelines was finally applied to all costs (at 60%) to reflect uncertainty in broad level analysis at the SMP scale.

### **H3.1.3 Methodology for calculating agricultural land prices**

Agricultural land values were calculated from land prices obtained from Defra (2006a)<sup>3</sup> Agricultural land sales and prices in England, Quarter End 31<sup>st</sup> December, 2006. For each agricultural grade a unique value (£ per ha) has been assigned according to Table 1 below.

---

<sup>3</sup> Defra 2006a National Statistics: Agricultural Land Sales and Prices in England. <http://statistics.defra.gov.uk/esg/statnot/alp.xls>

---

**Table H1:** Agricultural Land Sales in England, by Class (Defra, 2006a)

Year	Predominant Grade of Land														
	1 and 2			3			4 and 5			Not graded			All Grades		
	Number of sales	Area Sold (Ha)	Average Price (£ per Ha)	Number of sales	Area Sold (Ha)	Average Price (£ per)	Number of sales	Area Sold (Ha)	Average Price (£ per)	Number of sales	Area sold (Ha)	Average Price (£ per)	Number of sales	Area sold (Ha)	Average Price (£ per Ha)
1993	399	14,470	3,617	1,723	51,517	3,927	747	10,146	3,654	93	2,475	2,539	2,689	78,607	3,791

1999	489	16,319	7,354	2,384	58,566	7,313	483	13,384	4,043	81	3,266	2,576	3,437	91,534	6,673
2000	462	12,365	6,948	2,189	52,587	7,589	489	11,854	5,266	87	1,696	5,029	3,227	78,502	7,082
2001	391	13,313	7,072	1,794	43,832	7,904	354	7,132	5,297	64	1,105	5,271	2,603	65,383	7,406
2002†	397	12,524	6,696	2,067	50,444	7,610	477	11,642	4,848	88	2,877	4,158	3,029	77,487	6,915
2003†	315	11,036	7,043	1,700	40,346	7,659	375	11,093	6,143	69	2,387	4,325	2,459	64,861	7,172
2004†	205	6,275	7,256	1,077	23,713	8,289	244	5,973	6,572	44	1,674	4,016	1,570	37,634	7,654

Defra, 2006a also assigns a unique value (£ per Ha) for agricultural land in the south-east of England as shown in Table 2.

**Table H2:** Agricultural Land Sales in England, by Government Office Region (Defra, 2006a).

Year	South East			South West			England		
	Number of Sales	Area Sold (Ha)	Average Price (£ per Ha)	Number of sales	Area Sold (Ha)	Average Price (£ per Ha)	Number of Sales	Area Sold (Ha)	Average Price (£ per Ha)
1993	383	10,399	4,576	627	14,662	3,689	2,689	78,607	3,791
1994	457	13,843	4,908	559	13,196	4,115	2,811	86,576	4,229
1995	391	10,803	5,947	621	14,791	4,889	2,862	91,371	4,788
1996	506	13,412	6,845	693	16,089	6,067	3,425	105,743	6,058
1997	524	13,973	7,866	1,019	24,102	7,158	4,158	124,840	6,448
1998	426	10,031	8,277	856	18,927	6,775	3,498	103,802	6,134
1999	382	9,899	7,880	890	20,817	6,912	3,437	91,534	6,673
2000	321	8,183	8,584	922	18,930	7,870	3,227	78,502	7,082
2001	298	7,370	8,190	695	14,422	9,241	2,603	65,383	7,406
2002†	301	7,469	9,082	738	14,897	7,954	3,029	77,487	6,915
2003†	289	7,482	9,285	669	13,889	8,944	2,459	64,861	7,172
2004†	123	3,469	9,999	454	9,757	8,605	1,570	37,634	7,654

Therefore a combination of these two values was used to determine the average value of land, Grades 1, 2, 3, 4 and no grade, in the south-east of England. For example:

**Average cost of land in England = £7654 / ha**

**Average cost of land in south-east England = £9999 / ha**

**Therefore land in south-east England is 31% more expensive than average England prices.**

In accordance with the guidance in the Multi-Coloured Manual (2005)<sup>4</sup>, the values of land are multiplied by a factor of 0.65 to remove the cost of subsidies. As these figures are 2004 figures, inflation was added to bring the figures up to date (2007). The Bank of England inflation rates were checked and 3% per year was added for 2005, 2006 and 2007. Table 3 below illustrates the results.

<sup>4</sup> Flood Hazard Research Centre (2005) Multi-Coloured Manual. University of Middlesex.

**Table H3:** land values used to calculate 'financial loss' (Note: The figures in the end column were used to assign values in the economic assessment, to agricultural land losses due to flooding and erosion and to Managed Realignment.)

Grade	Ave price per hectare (£ per ha) 2004	Average price (£ per ha) for south east England 2004	Price (£ per ha) multiplied by 0.65 to remove the cost of subsidies	Price (£ per ha) updated to 2007 base date (3% pa) (3 pa ha)
1 & 2	7256	9479	6161	6733
3	8289	10829	7039	7691
4&5	6572	8586	5581	6098
no grade	4016	5246	3410	3726

### H3.2 Comparison of costs and benefits

As this review is not a full economic assessment, a formal benefit-cost assessment using benefit-cost ratios (BCR) has not been conducted; rather, the information available has been used to review the robustness of the preferred plan.

In comparing likely benefits and likely costs for the policies for an individual location, over the full 100 year period, it is however still useful in some instances to be able to consider these in terms of Present Value (PV).

Present Value is the value of a stream of benefits or costs when discounted back to the present day. For this SMP, the discount factors used are the latest provided by Defra for assessment of schemes, i.e. 3.5% for years 0-30, 3.0% for years 31-75, and 2.5% thereafter.

For calculation of PV damages/damages, the approximate timing of property losses has been determined using MDSF and corresponding discount factors applied accordingly. For calculation of PV costs for defence replacement, the average discount factor for each epoch has been used, the actual timing of works being uncertain at present. The year-on-year maintenance PV costs have been calculated using the total of the discount rates for that epoch.

The figures generated for this SMP are presented only in CV in **Section H4**, reflecting the 'broad-scale' nature of the assessments undertaken. However, for further information, the PV of these figures are presented in **Annex H1** (for benefits/damages) and **Annex H2** (for costs).

### H3.3 Sensitivity assessments

At selected locations, the economic viability of alternative defence policies has been assessed as a sensitivity case, where the alternative is potentially economically viable (see **Section H4** and **Annex H2**).

## H4 Economic appraisal summary tables

The Tables below provides a summary of the economic review of the preferred plan **for each Policy Unit**. It outlines any information used in this review, including benefits and costs, together with a statement on economic viability. Example Managed Realignment costs are based on the capital value and maintenance costs of a set back embankment (the example extents used in these calculations are mapped in **Annex H4** and costs for realigned revetments are included in **Annex H2**). Note: An allowance should be made for errors of approximately +/- £1m in each epoch, due to an error allowance of +/- 250m in the measurement of defence lengths for each unit.

Table H4.A summarises the cost benefit of each policy and the plan as a whole. Table H4.B provides more detailed information and discussion on the cost and benefit build up for each policy.

E4 30 Medway Islands	NAI	NAI	NAI	<p><b><u>NAI Damages:</u></b>                      Loss of two Scheduled Monuments in the long term.</p> <p><b>Agricultural land loss:</b>                      Non-agricultural: 5.5ha                      = Capital value of agricultural land loss is c. <b>£0.02m.</b></p>	No intervention planned.	NAI policy is appropriate as no other option would be economically viable. However in the long term this policy will lead to the loss of two Scheduled Monuments.

## H5 Economic sensitivity assessment summary tables

Table H5.1 below provides a summary of the economic reviews undertaken for selected locations that required a sensitivity assessment. The table summarises the calculated benefits and costs, together with a statement on economic viability when assessing the alternative policy of hold the line as a sensitivity test, along policy units where managed realignment is proposed. Also, in response to stakeholder concerns that the original economic assessment given in **Section H4** of the present appendix undervalued agricultural land, the sensitivity analysis presented here has increased agricultural land values by a factor of 2. The conclusions show that this did not change the economic viabilities of the preferred policy option. Corresponding HTL defence tables are found in **Annex H2**. Note: An allowance should be made for errors of approximately +/- £1m in each epoch, due to an error allowance of +/- 250m in the measurement of defence lengths for each unit.

**Table H5.1** Sensitivity Assessment of a Hold the Line policy, where Managed Realignment is the proposed policy.

Location	Policy			Description of Alternative tested	Broad-scale Review (this SMP)		Conclusions
					Alternative Damages and Benefits Capital Value (CV)	Alternative Costs Capital Value (CV)	
<b>(HTL = Hold the Line; MR = Managed Realignment; NAI = No Active Intervention)</b>							
E4 02 Colemouth Creek to Bee Ness Jetty	MR with localis ed HTL	MR with localis ed HTL	MR with localis ed HTL	Hold the Line along the whole frontage.	Protection of environmental assets (not evaluated).	To maintain and replace an embankment over the 6km frontage would cost: £1.9m CV in years 0-20 £11.5m CV in years 20-50 £28.8m CV in years 50-100 (Total £42.2m CV) These figures allow for maintenance and replacement, optimum bias and climate change.	This alternative is not considered economically preferable. The provision of defences to HTL is more costly compared to potential costs for MR along sections of this frontage. MR with localised HTL would cost: £3.0m CV in years 0-20 £8.6m CV in years 20-50 £21.6m CV in years 50-100 (Total £33.3m CV) These figures allow for maintenance and replacement, optimum bias and climate change.

					added opportunity for habitat creation in realigned areas.

As part of the Economic Assessment, flood damages have been calculated on a policy unit by policy unit basis, based on damages within flood cells. Along a number of frontages within the SMP boundaries, flood cells extend over multiple policy units. As a sensitivity test, where a number of Policy Units extend over one or more flood cells, the No Active Intervention damages for these flood cells have been combined to give a value for 'total damages' for the flood areas affected, and defence costs for the associated Policy Units have been aggregated to provide a value for 'total costs'. The calculated 'total' damage and cost values are compared and summarised in Table H5.2. The conclusions show that this assessment did not change the economic viabilities of the preferred policy option.

Note: An allowance should be made for errors of approximately +/- £1m in each epoch, due to an error allowance of +/- 250m in the measurement of defence lengths for each unit.

## H6 Sensitivity Testing

Sensitivity Analysis was undertaken to highlight uncertainty or risks in key variables that may affect policy decisions and identifies the consequences for the preferred scenario. Examples of uncertainty include:

- Anticipated changes in development: regeneration/ development / decommissioning of assets;
- Contamination of land, locations which maybe at risk including: Power Stations, Historic industrial areas, Dockyards, Industrial areas, Historic landfill sites and Contemporary landfill sites;
- Change in environmental legislation, i.e. increased / decreased importance of environmental designations; and,
- Climate change / sea-level rise / increased storminess / increased fluvial flows.
- An increasing importance of agriculture linked with the issue of food security in the future.

The following tables provide a qualitative assessment of the sensitivity of proposed policies to change. Sensitivity analysis was also applied during cost benefit analysis to confirm the robustness of the policies e.g. agricultural land values were doubled to gauge the sensitivity of increased agricultural importance.

SMP Procedural Guidance states that it is not appropriate to speculate regarding uncertainties in changes in social attitudes or socio-economic policy; as such, the following uncertainties are acknowledged here, but are not included in the main analysis:

- A change in social preferences in relation to an increased acceptance to flood and erosion and / or adaptive methods;
- A change in funding priorities leading to increased / decreased funding;
- Availability of compensation for those affected by flooding and / or erosion; and

Supporting information regarding contemporary climate change predictions and corresponding implications for the Medway and Swale estuaries are found in **Annex H3**.

### H6.1 Uncertainty Identification Table

The table below indicates the degree to which the four generic management policies are exposed to identified uncertainties.

Uncertainty	Exposure to Uncertainty			
	HTL	ATL	MR	NAI
<b>Change in land use – increased development</b>	Maintaining the defence line will provide a suitable standard of protection for increased development	Advancing the defence line will provide a suitable standard of protection for increased development	Realigning the defence line is not favourable for increased development <b>MR policy exposed to this uncertainty</b>	No Active Intervention is not favourable for increased development <b>NAI policy exposed to this uncertainty</b>
<b>Change in land use – decreased development</b>	Maintaining the defence line may not be economically justifiable as development decreases <b>HTL policy exposed to this uncertainty</b>	Advancing the defence line may not be economically justifiable as development decreases <b>ATL policy exposed to this uncertainty</b>	Realigning the defences is possible as development decreases	No Active Intervention will not provide protection to remaining assets <b>NAI policy exposed to this uncertainty</b>
<b>Increased rates of SLR</b>	Under a scenario of HTL sea level rise may result in coastal squeeze and increased wave energy at defences. Defences will become more expensive and technically difficult to maintain <b>HTL policy exposed to this uncertainty</b>	Under a scenario of ATL sea level rise may result in greater coastal squeeze and greater increased wave energy at defences. It is likely that the intertidal will be lost. Defences will become more expensive and technically difficult to maintain <b>ATL policy exposed to this uncertainty</b>	Under a scenario of MR sea level rise may be accommodated. Over time defences will become more expensive and technically difficult to maintain especially in areas of low lying hinterland <b>MR policy exposed to this uncertainty</b>	Under a scenario of NAI sea level rise will result in uncontrolled inundation of water. Erosion rates could increase and /or erosion may be reactivated where the shoreline was previously defended <b>NAI policy exposed to this uncertainty</b>
<b>Increased fluvial flows (estuary)</b>	Increased fluvial flows may increase channel erosion and render defences more susceptible to undermining. Defences will become more	Increased fluvial flows may increase channel erosion and render defences more susceptible to undermining, this will be exacerbated by channel	Retreated defence line may provide a flood storage area to manage the accommodation of flood inundation from increased fluvial flows, however increased	No Active intervention will result in uncontrolled inundation of flood waters from increased fluvial flows. Increased fluvial flows will increase erosion of

Uncertainty	Exposure to Uncertainty			
	HTL	ATL	MR	NAI
	expensive and technically difficult to maintain <b>HTL policy exposed to this uncertainty</b>	narrowing with advanced defences. Defences will become more expensive and technically difficult to maintain <b>ATL policy exposed to this uncertainty</b>	fluvial flows may increase channel erosion and render defences more susceptible to undermining. Over time defences will become more expensive and technically difficult to maintain <b>MR policy exposed to this uncertainty</b>	channels and potentially re-activate channel meandering <b>NAI policy exposed to this uncertainty</b>
<b>Reductions in sediment supply</b>	A reduced sediment supply may increase the exposure of defences to wave energy, defences will become more expensive and technically difficult to maintain <b>HTL policy exposed to this uncertainty</b>	A reduced sediment supply may increase exposure of defences to wave energy, advancing the defence line will exacerbate this exposure, consequently defences will become more expensive and technically difficult to maintain. ATL may also affect longshore sediment transport processes within the estuary <b>ATL policy exposed to this uncertainty</b>	Retreated defence line will allow fines to be released into the estuary system as sediments are reworked	No Active Intervention will allow fines to be released into the estuary system as sediments are reworked
<b>Increasing storminess</b>	With increased wave energy at defences, defences will become more expensive and technically difficult to maintain <b>HTL policy exposed to this uncertainty</b>	With increased wave energy at defences with increased storminess, a reduced foreshore will exacerbate wave energy further. Defences will become more expensive and technically difficult to maintain <b>ATL policy exposed to this uncertainty</b>	Realigning the defences will allow wave energy to be dissipated over a larger area, in a managed manner. However over time, with increased wave energy at defences, defences will become more expensive and technically difficult to maintain <b>MR policy exposed to this uncertainty</b>	No active intervention will result in uncontrolled flooding and erosion, however although NAI remains susceptible to increased storminess, NAI will allow wave energy to be dissipated over a larger area <b>NAI policy exposed to this uncertainty</b>

Uncertainty	Exposure to Uncertainty			
	HTL	ATL	MR	NAI
<b>Land may be contaminated</b>	Maintaining the defence line will continue to provide a suitable standard of protection for potentially contaminated land	Advancing the defence line may increase the standard of protection to potentially contaminated land	Contaminated land would require expensive remediation if MR was implemented, otherwise contaminants may be released into the estuary system <b>MR policy exposed to this uncertainty</b>	If the land is contaminated, NAI would allow contaminants to be released into the estuary system <b>MR policy exposed to this uncertainty</b>
<b>Change in legislation on habitat designation</b>  <b>FRESHWATER HABITATS</b>	<b>Increased Importance</b>			
	Increased requirement to maintain and improve habitats, maintaining the defence line will provide a suitable standard of protection to freshwater habitats	Increased requirement to maintain and improve habitats, advancing the defence line will increase the standard of protection to freshwater habitats	Increased requirement to maintain and improve habitats, MR would result in the managed loss of freshwater habitats <b>MR policy exposed to this uncertainty</b>	Increased requirement to maintain and improve habitats, NAI would result in the uncontrolled loss of freshwater habitats <b>NAI policy exposed to this uncertainty</b>
	<b>Decreased Importance</b>			
	Decreased requirement to maintain and improve habitats, maintaining the defence line may not be justifiable <b>HTL policy exposed to this uncertainty</b>	Decreased requirement to maintain and improve habitats, advancing the defence line to provide an increased standard of protection may not be justifiable <b>ATL policy exposed to this uncertainty</b>	Decreased requirement to maintain and improve habitats, acceptable managed loss of freshwater habitats	Decreased requirement to maintain and improve habitats, acceptable uncontrolled loss of freshwater habitats
<b>Change in legislation on habitat designation</b>  <b>INTERTIDAL HABITATS</b>	<b>Increased Importance</b>			
	Increased requirement to maintain and improve habitats, maintaining the defence line may result in coastal squeeze and loss of intertidal habitats	Increased requirement to maintain and improve habitats, advancing the defence line will result in the loss of intertidal habitats	Increased requirement to maintain and improve habitats, MR will result in the managed creation of intertidal habitat	Increased requirement to maintain and improve habitats, NAI will result uncontrolled flooding and intertidal habitat creation

Uncertainty	Exposure to Uncertainty			
	HTL	ATL	MR	NAI
	<b>HTL policy exposed to this uncertainty</b>	<b>ATL policy exposed to this uncertainty</b>		
	<b>Decreased Importance</b>			
	Decreased requirement to maintain and improve habitats, acceptable loss of habitat due to coastal squeeze when maintaining the defence line	Decreased requirement to maintain and improve habitats, acceptable loss of habitat with an advanced the defence line	Decreased requirement to maintain and improve habitats, MR for habitat creation may not be economically justifiable <b>MR policy exposed to this uncertainty</b>	Decreased requirement to maintain and improve habitats, therefore decreased importance of this habitat does not support a policy of NAI <b>NAI policy exposed to this uncertainty</b>

### H6.2 Sensitivity Table

The following table identifies the uncertainties / risks which may affect each policy management unit, the potential consequences of the uncertainties, the main policies exposed to each uncertainty and in which epoch, and an overall assessment of the proposed policy in relation to its exposure to identified uncertainties.

Proposed Policy Unit		Epoch 1 (0-20 years)	Epoch 2 (20-50 years)	Epoch 3 (50-100 years)	Uncertainty	Consequence	Exposure to Uncertainty (Epochs 1, 2 and 3)		Overall assessment of proposed policy
E4 01	<b>Grain Tower to Colemouth Creek</b>	HTL	HTL	HTL	Change in land use – increased development (residential, commercial, infrastructure) (Former Oil refinery site proposed as Thames Gateway regeneration area)	Development of more residential properties and infrastructure could lead to continued requirement for HTL.	HTL ATL <b>MR</b> <b>NAI</b>	◆ 1,2,3 ◆ 1,2,3	Acceptable policies, they are not unduly exposed to uncertainties compared to other policies
					Change in land use - (decommission of Power Station)	Reduced requirement for flood and erosion risk management	<b>HTL</b> <b>ATL</b> MR <b>NAI</b>	◆ 2,3 ◆ 2,3 ◆ 2,3	
					Increased rates of SLR	Increase in water levels. Defences may become more expensive and technically more difficult to maintain.	<b>HTL</b> <b>ATL</b> <b>MR</b> <b>NAI</b>	◆ 2,3 ◆ 1,2,3 ◆ 3 ◆ 3	
					Reductions in sediment supply	Reduction in protective foreshore cover, increased wave energy at defences. Defences may become more expensive and technically difficult to maintain.	<b>HTL</b> <b>ATL</b> MR NAI	◆ 2,3 ◆ 2,3	

Proposed Policy Unit		Epoch 1 (0-20 years)	Epoch 2 (20-50 years)	Epoch 3 (50-100 years)	Uncertainty	Consequence	Exposure to Uncertainty (Epochs 1, 2 and 3)		Overall assessment of proposed policy
					Increasing storminess	Increase in wave energy. Defences may become more expensive and technically more difficult to maintain.	HTL	◆ 2,3	
					Land may be contaminated - (due to Power Station)	Contaminants may be released unless expensive remediation is implemented.	HTL	◆ 1,2,3	
					Change in legislation on habitat designation	Reduced/increased requirement for protection/conservation of habitats	HTL	◆ 1,2,3	
E4 02	<b>Colemouth Creek to Bee Ness Jetty</b>	MR with localised HTL	MR with localised HTL	MR with localised HTL	Change in land use – increased development (infrastructure to proposed regeneration area)	Increased development of infrastructure could lead to continued requirement for HTL	HTL	◆ 1,2,3	MR / NAI are exposed to most uncertainties, however MR will only be more exposed in discrete areas along the frontage and in later epochs. HTL is less exposed to uncertainties
					Increased rates of SLR	Increase in water levels. Defences may become more expensive and technically more difficult to maintain.	HTL	◆ 2,3	
					Reductions in sediment supply	Reduction in protective foreshore cover, increased wave energy at defences. Defences may become more expensive and technically difficult to maintain.	HTL	◆ 2,3	
							ATL	◆ 1,2,3	
							MR	◆ 3	
							NAI	◆ 3	

Proposed Policy Unit		Epoch 1 (0-20 years)	Epoch 2 (20-50 years)	Epoch 3 (50-100 years)	Uncertainty	Consequence	Exposure to Uncertainty (Epochs 1, 2 and 3)		Overall assessment of proposed policy
					Land may be contaminated - (due to Landfill)	Contaminants may be released unless expensive remediation is implemented.	HTL ATL <b>MR</b> <b>NAI</b>	◆ 1,2,3 ◆ 1,2,3	
					Change in legislation on habitat designation	Reduced/increased requirement for protection/conservation of habitats	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3 ◆ 1,2,3 ◆ 1,2,3	
E4 03	<b>Kingsnorth Power Station</b>	HTL	HTL	HTL	Change in land use - (New Power Station proposed alongside Kingsnorth Power station)	Development of a further Power Station could lead to continued requirement for HTL.	HTL ATL <b>MR</b> <b>NAI</b>	◆ 1,2,3 ◆ 1,2,3	Acceptable policies, they are not unduly exposed to uncertainties compared to other policies
					Change in land use - (decommission of Power Station)	Reduced requirement for flood and erosion risk management	HTL ATL MR NAI	◆ 2,3 ◆ 2,3 ◆ 2,3	
					Increased rates of SLR	Increase in water levels. Defences may become more expensive and technically more difficult to maintain.	HTL ATL MR NAI	◆ 2,3 ◆ 1,2,3 ◆ 3 ◆ 3	
					Reductions in sediment supply	Reduction in protective foreshore cover, increased wave energy at defences. Defences may become more expensive and technically difficult to maintain.	HTL ATL MR NAI	◆ 2,3 ◆ 2,3	

Proposed Policy Unit		Epoch 1 (0-20 years)	Epoch 2 (20-50 years)	Epoch 3 (50-100 years)	Uncertainty	Consequence	Exposure to Uncertainty (Epochs 1, 2 and 3)		Overall assessment of proposed policy
					Land may be contaminated – (due to historic landfill & Power Station)	Contaminants may be released unless expensive remediation is implemented.	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3	
					Change in legislation on habitat designation	Reduced/increased requirement for protection/conservation of habitats	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3 ◆ 1,2,3 ◆ 1,2,3	
E4 04	<b>Power Station to Cockham Wood</b>	MR with localised HTL	MR with localised HTL	MR with localised HTL	Increased rates of SLR	Increase in water levels. Defences may become more expensive and technically more difficult to maintain.	HTL ATL MR NAI	◆ 2,3 ◆ 1,2,3 ◆ 3 ◆ 3	HTL / ATL are exposed to most uncertainties along some lengths of frontage, MR / NAI have the least exposure to uncertainty therefore suggesting that MR is a robust policy
					Reductions in sediment supply	Reduction in protective foreshore cover, increased wave energy at defences. Defences may become more expensive and technically difficult to maintain.	HTL ATL MR NAI	◆ 2,3 ◆ 2,3	
					Change in legislation on habitat designation	Reduced/increased requirement for protection/conservation of habitats	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3 ◆ 1,2,3 ◆ 1,2,3	
E4 05	<b>Hoo Marina to Lower Upnor</b>	NAI	NAI	NAI	Increased rates of SLR	Increase in water levels. Defences may become more expensive and technically more difficult to maintain.	HTL ATL MR NAI	◆ 2,3 ◆ 1,2,3 ◆ 3 ◆ 3	HTL / ATL are exposed to most uncertainties, MR / NAI are

Proposed Policy Unit		Epoch 1 (0-20 years)	Epoch 2 (20-50 years)	Epoch 3 (50-100 years)	Uncertainty	Consequence	Exposure to Uncertainty (Epochs 1, 2 and 3)		Overall assessment of proposed policy
					Reductions in sediment supply	Reduction in protective foreshore cover, increased wave energy at defences. Defences may become more expensive and technically difficult to maintain.	HTL ATL MR NAI	◆ 2,3 ◆ 2,3	least exposed to uncertainties therefore suggesting NAI is a robust policy
					Change in legislation on habitat designation	Reduced/increased requirement for protection/conservation of habitats	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3 ◆ 1,2,3 ◆ 1,2,3	
E4 06	Lower Upnor to Medway bridge	HTL	HTL	HTL	Change in land use – increased development (Strood Riverside proposed development area and regeneration of waterfront)	Development of more residential properties and infrastructure could lead to continued requirement for HTL.	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3	MR / NAI are exposed to most uncertainties, HTL / ATL are least exposed therefore suggesting that HTL is a robust policy
					Increased rates of SLR	Increase in water levels. Defences may become more expensive and technically more difficult to maintain.	HTL ATL MR NAI	◆ 2,3 ◆ 1,2,3 ◆ 3 ◆ 3	
					Increased fluvial flows	Increasing rates of SLR result in faster flows in confined areas and increased erosion of defences. Defences may become more expensive and technically difficult to maintain	HTL ATL MR NAI	◆ 2,3 ◆ 2,3 ◆ 2,3 ◆ 2,3	
					Land may be contaminated – (due to historic landfill)	Contaminants may be released unless expensive remediation is implemented.	HTL ATL MR	◆ 1,2,3	

Proposed Policy Unit		Epoch 1 (0-20 years)	Epoch 2 (20-50 years)	Epoch 3 (50-100 years)	Uncertainty	Consequence	Exposure to Uncertainty (Epochs 1, 2 and 3)		Overall assessment of proposed policy
							NAI	◆ 1,2,3	
E4 07	Medway Bridge to North Halling	HTL	HTL	HTL	Change in land use – increased development	Development of more residential and commercial properties and infrastructure could lead to continued requirement for HTL	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3	HTL is less exposed to uncertainties, suggesting that HTL is a robust policy
					Increased rates of SLR	Increase in water levels. Defences may become more expensive and technically more difficult to maintain.	HTL ATL MR NAI	◆ 2,3 ◆ 1,2,3 ◆ 3 ◆ 3	
					Increased fluvial flows	Increasing fluvial flows will result in faster flows in confined areas and increased erosion of defences. Defences may become more expensive and technically difficult to maintain	HTL ATL MR NAI	◆ 2,3 ◆ 2,3 ◆ 2,3 ◆ 2,3	
E4 08	North Halling to Snodland	MR with localised HTL	MR with localised HTL	MR with localised HTL	Change in land use – increased development	Development of more residential and commercial properties and infrastructure could lead to continued requirement for HTL	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3	MR / NAI are exposed to most uncertainties, however MR will only be more exposed in discrete areas along the frontage
					Increased rates of SLR	Increase in water levels. Defences may become more expensive and technically more difficult to maintain.	HTL ATL MR NAI	◆ 2,3 ◆ 1,2,3 ◆ 3 ◆ 3	

Proposed Policy Unit		Epoch 1 (0-20 years)	Epoch 2 (20-50 years)	Epoch 3 (50-100 years)	Uncertainty	Consequence	Exposure to Uncertainty (Epochs 1, 2 and 3)		Overall assessment of proposed policy
					Increased fluvial flows	Increasing fluvial flows will result in faster flows in confined areas and increased erosion of defences. Defences may become more expensive and technically difficult to maintain	HTL	◆ 2,3	and in later epochs. HTL is less exposed to uncertainties
					Land may be contaminated – (due to historic landfill)	Contaminants may be released unless expensive remediation is implemented.	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3	
					Change in legislation on habitat designation	Reduced/increased requirement for protection/conservation of habitats	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3 ◆ 1,2,3 ◆ 1,2,3	
E4 09	Snodland to Allington Lock	HTL	MR with localised HTL	MR with localised HTL	Increased rates of SLR	Increase in water levels. Defences may become more expensive and technically more difficult to maintain.	HTL ATL MR NAI	◆ 2,3 ◆ 1,2,3 ◆ 3 ◆ 3	MR / NAI are exposed to most uncertainties, however MR will only be more exposed in discrete areas along the frontage and in later epochs. HTL is less exposed to uncertainties
					Increased fluvial flows	Increasing rates of SLR result in faster flows in confined areas and increased erosion of defences. Defences may become more expensive and technically difficult to maintain	HTL ATL MR NAI	◆ 2,3 ◆ 2,3 ◆ 2,3 ◆ 2,3	
					Land may be contaminated – (due to industry)	Contaminants may be released unless expensive remediation is	HTL ATL		

Proposed Policy Unit		Epoch 1 (0-20 years)	Epoch 2 (20-50 years)	Epoch 3 (50-100 years)	Uncertainty	Consequence	Exposure to Uncertainty (Epochs 1, 2 and 3)		Overall assessment of proposed policy
						implemented.	<b>MR</b>	◆ 1,2,3	
					Change in legislation on habitat designation	Reduced/increased requirement for protection/conservation of habitats	<b>HTL</b> <b>ATL</b> <b>MR</b> <b>NAI</b>	◆ 1,2,3 ◆ 1,2,3 ◆ 1,2,3 ◆ 1,2,3	
					Change in land use – increased development	Development of more residential and commercial properties and infrastructure could lead to continued requirement for HTL	<b>HTL</b> <b>ATL</b> <b>MR</b> <b>NAI</b>	◆ 1,2,3 ◆ 1,2,3	
E4 10	<b>Allington Lock to north Wouldham</b>	HTL	MR with localised HTL	MR with localised HTL	Change in land use – increased development	Development of more residential and commercial properties and infrastructure could lead to continued requirement for HTL	<b>HTL</b> <b>ATL</b> <b>MR</b> <b>NAI</b>	◆ 1,2,3 ◆ 1,2,3	MR / NAI are exposed to most uncertainties, however MR will only be more exposed in discrete areas along the frontage and in later epochs. HTL is less exposed to uncertainties
					Increased rates of SLR	Increase in water levels. Defences may become more expensive and technically more difficult to maintain.	<b>HTL</b> <b>ATL</b> <b>MR</b> <b>NAI</b>	◆ 2,3 ◆ 1,2,3 ◆ 3 ◆ 3	
					Increased fluvial flows	Increasing fluvial flows will result in faster flows in confined areas and increased erosion of defences. Defences may become more expensive and technically difficult to maintain	<b>HTL</b> <b>ATL</b> <b>MR</b> <b>NAI</b>	◆ 2,3 ◆ 2,3 ◆ 2,3 ◆ 2,3	

Proposed Policy Unit		Epoch 1 (0-20 years)	Epoch 2 (20-50 years)	Epoch 3 (50-100 years)	Uncertainty	Consequence	Exposure to Uncertainty (Epochs 1, 2 and 3)		Overall assessment of proposed policy
					Change in legislation on habitat designation	Reduced/increased requirement for protection/conservation of habitats	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3 ◆ 1,2,3 ◆ 1,2,3	
E4 11	<b>Wouldham Marshes</b>	MR	MR	MR	Increased rates of SLR	Increase in water levels. Defences may become more expensive and technically more difficult to maintain.	HTL ATL MR NAI	◆ 2,3 ◆ 1,2,3 ◆ 3 ◆ 3	Acceptable policies, they are not unduly exposed to uncertainties compared to other policies
					Increased fluvial flows	Increasing fluvial flows will result in faster flows in confined areas and increased erosion of defences. Defences may become more expensive and technically difficult to maintain	HTL ATL MR NAI	◆ 2,3 ◆ 2,3 ◆ 2,3 ◆ 2,3	
					Change in legislation on habitat designation	Reduced/increased requirement for protection/conservation of habitats	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3 ◆ 1,2,3 ◆ 1,2,3	
E4 12	<b>Medway Bridge to east St Mary's Island</b>	HTL	HTL	HTL	Change in land use – increased development (Rochester Riverside proposed Thames Gateway regeneration area; Chatham Riverside proposed development area; Chatham Docks)	Development of more residential and commercial properties and infrastructure could lead to continued requirement for HTL	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3	MR / NAI are exposed to most uncertainties, HTL / ATL on balance are least exposed

Proposed Policy Unit		Epoch 1 (0-20 years)	Epoch 2 (20-50 years)	Epoch 3 (50-100 years)	Uncertainty	Consequence	Exposure to Uncertainty (Epochs 1, 2 and 3)		Overall assessment of proposed policy
					Land may be contaminated – (due to dockyard)	Contaminants may be released unless expensive remediation is implemented.	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3	to uncertainties suggesting that HTL is a robust policy
					Increased rates of SLR	Increase in water levels. Defences may become more expensive and technically more difficult to maintain.	HTL ATL MR NAI	◆ 2,3 ◆ 1,2,3 ◆ 3 ◆ 3	
					Increased fluvial flows	Increasing fluvial flows will result in faster flows in confined areas and increased erosion of defences. Defences may become more expensive and technically difficult to maintain	HTL ATL MR NAI	◆ 2,3 ◆ 2,3 ◆ 2,3 ◆ 2,3	
E4 13	St Mary's Island to the Strand	HTL	HTL	HTL	Change in land use – increased development (St Mary's Island regeneration area)	Development of more residential and commercial properties and infrastructure could lead to continued requirement for HTL	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3	MR / NAI are exposed to most uncertainties, HTL / ATL on balance are least exposed to uncertainties suggesting that HTL is a robust policy
					Land may be contaminated – (due to historic landfill)	Contaminants may be released unless expensive remediation is implemented.	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3	
					Increased rates of SLR	Increase in water levels. Defences may become more expensive and technically more difficult to maintain.	HTL ATL MR	◆ 2,3 ◆ 1,2,3 ◆ 3	

Proposed Policy Unit		Epoch 1 (0-20 years)	Epoch 2 (20-50 years)	Epoch 3 (50-100 years)	Uncertainty	Consequence	Exposure to Uncertainty (Epochs 1, 2 and 3)		Overall assessment of proposed policy
							NAI	◆ 3	
					Increased fluvial flows	Increasing fluvial flows will result in faster flows in confined areas and increased erosion of defences. Defences may become more expensive and technically difficult to maintain	HTL ATL MR NAI	◆ 2,3 ◆ 2,3 ◆ 2,3 ◆ 2,3	
E4 14	The Strand to west Motney Hill	HTL	MR	MR	Change in land use – increased development	Development of more residential and commercial properties and infrastructure could lead to continued requirement for HTL	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3	MR / NAI are exposed to most uncertainties, however MR will only be more exposed in later epochs. HTL is less exposed to uncertainties
					Increased rates of SLR	Increase in water levels. Defences may become more expensive and technically more difficult to maintain.	HTL ATL MR NAI	◆ 2,3 ◆ 1,2,3 ◆ 3 ◆ 3	
					Reductions in sediment supply	Reduction in protective foreshore cover, increased wave energy at defences. Defences may become more expensive and technically difficult to maintain.	HTL ATL MR NAI	◆ 2,3 ◆ 2,3	
					Land may be contaminated – (due to historic landfill)	Contaminants may be released unless expensive remediation is implemented.	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3	
					Change in legislation on habitat	Reduced/increased requirement for	HTL	◆ 1,2,3	

Proposed Policy Unit		Epoch 1 (0-20 years)	Epoch 2 (20-50 years)	Epoch 3 (50-100 years)	Uncertainty	Consequence	Exposure to Uncertainty (Epochs 1, 2 and 3)		Overall assessment of proposed policy
					designation	protection/conservation of habitats	ATL MR NAI	◆ 1,2,3 ◆ 1,2,3 ◆ 1,2,3	
E4 15	<b>Motney Hill to Ham Green</b>	MR with opportunities for HTL	MR with opportunities for HTL	MR with opportunities for HTL	Change in land use – increased development	Development of more residential and commercial properties and infrastructure could lead to continued requirement for HTL	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3	MR / NAI are exposed to most uncertainties, however MR will only be more exposed in discrete areas along the frontage and in later epochs. HTL is less exposed to uncertainties
					Increased rates of SLR	Increase in water levels. Defences may become more expensive and technically more difficult to maintain.	HTL ATL MR NAI	◆ 2,3 ◆ 1,2,3 ◆ 3 ◆ 3	
					Reductions in sediment supply	Reduction in protective foreshore cover, increased wave energy at defences. Defences may become more expensive and technically difficult to maintain.	HTL ATL MR NAI	◆ 2,3 ◆ 2,3	
					Land may be contaminated – (due to historic landfill)	Contaminants may be released unless expensive remediation is implemented.	HTL ATL MR NAI	◆ 1,2,3 ◆ 1,2,3

## **A-H1.2 Summary of Preferred Plan Erosion Losses**

Analysis of preferred plan erosion losses using MDSF has indicated that no residential or commercial erosion losses are expected. However, in management unit E4 16, one residential property and greenhouses may be at increased risk from erosion in the long term. This will be dependant on future erosion rates along the frontage.

---

## Annex H2: Supporting economic appraisal data for SMP Costs

This annex presents the full preferred scenario costs developed for the SMP. As outlined in the assumptions below, these are generated from national generic costs and do not reflect local conditions. These figures should not be considered out of context. The costs presented in section H4 have been taken from available strategy and/or scheme documents where available, as these represent a more accurate and site specific consideration of implementation costs. The figures presented in this Annex have only been used where other, more detailed, cost information is not available. As such the costs presented here differ from those in **section H4** for frontages where more detailed costs are available.

### **Basis for cost assumptions:**

- Replacement costs taken from SMP Procedural Guidance (Defra, 2006). This sets replacement costs for linear structures (e.g. revetments, seawalls) at £2.7million/km and cost for beach management schemes at £5.1million/km. Groyne field costs and embankments are taken as £0.6million/km;
- Maintenance costs taken from NADNAC study prepared for Defra (2004). This sets annual maintenance cost for linear structures and for groyne fields at £10k/km and for beach schemes £20k/km;
- Assumed design life (and thus full scheme reconstruction will be required) as 100 years for linear defences, 50 years for beach schemes and 30 years for groynes.
- Allow for maintenance as a linear cost, although realistically less in early years and increasing in latter years of scheme life;
- Allowance for increase in costs due to climate change: Period 20-50 years - costs factored up by 1.5 x present day rates; Period 50-100 years - costs factored up by 2.0x present day rates;
- Optimism bias (at 60%) to be applied to all costs when examining BCR, to reflect uncertainty in broad level analysis at SMP scale;
- For "low cost" defence structures use same rate as groynes; and,
- Rates for typical defences types used:

Defence Type	Cost per km	
	Replacement	Maintenance
BEACH (B)	£5,100,000	£20,000
LINEAR (L)	£2,700,000	£10,000
GROYNE/OTHER (G)	£600,000	£10,000

## Annex H3: Supporting information for Sensitivity Testing

Proposed climate change scenarios (Defra, 2006)<sup>6</sup>:

Area	Assumed Vertical Land Movement (mm/yr)	Net Sea level Rise (mm/yr)			
		1990-2025	2025-2055	2055-2085	2085-2115
South-East of England	-0.8	4	8.5	12	15
Indicative Sensitivity Range - Peak river flow volume (within estuaries)		+10%	+20%		
Indicative Sensitivity Range – Extreme Wave Height / Offshore wave height (at entrances to estuaries)		+5%		+10%	
		+5%		+10%	

Consequences for the Medway and Swale estuaries (in mOD) with regards to Defra (2006) climate change predictions:

	MHWS				MSL			
	Present	2025 (+76mm)	2055 (+255 mm)	2105 (+660 mm)	Present	2025 (+76m)	2055 (+255 mm)	2105 (+660 mm)
